DM-40 - All purpose cleaner soil based on IKW protocol

DM-40 is a relatively stubborn fatty soil with added carbon black. This soil is based on the soil used in the IKW recommendation for the quality assessment of the product performance of All-Purpose cleaners.

Because the production of these IKW tiles involves long waiting times and is very labourintensive, we decided to develop a ready-to-use testmaterial with the same soil. Our quality control is based on the requirements of the IKW recommendation, so there is a good correlation with the actual IKW tiles.

The graph on the right shows a detergent comparison between the IKW reference detergent and a selection of market detergents. This graph shows clear differences between these detergents. The test was performed in the CFT version of the TQC Sheen Washability Tester

TQC Sheen Washability Tester used on the DM-40 tiles
