

THE CFT SWATCHBOOK

EDITION 2025.275

The information contained in these documents is confidential, privileged and only for the information of the intended recipient and may not be used, published or redistributed without the prior written consent of Center for Testmaterials.

Introduction

The book in front of you is the Swatchbook. In this book, you can find our entire range of Standardized Testmaterials produced by CFT. This can be a useful tool to help you select the stains that are most suitable for your research.

The Swatchbook contains the following parts: A description of how to use this Swatchbook, an index of our standardized Testmaterials, product sheets with a full description of our Standardized Testmaterials, an application legend, and an index of our Standardized Testmaterials in Alphabetical order.

CFT has two distinctively forms of production methods:

- Standardized Testmaterials
- Circular Stains

This book only contains the Standardized Testmaterials, a separate book is available for our Circular Stains. We firmly believe that there is a need for both these types of testmaterials in the industry. Both have their own advantages and disadvantages.

Standardized Testmaterials are cost-effective, present less variability, and are usually available from stock. Circular Stains will appear more consumer realistic. Therefore, they are more applied in claim support or marketing activities. Another advantage is that it is possible to produce only a small batch at a time or even a lot of different stains in a short period of time.

Useful fact about our Standardized Testmaterials:

- At least usable up to a half year after delivery, as labeled on the package.
- We can die cut the fabrics in almost any size.
- Customized soiling is available on request.

Feel free to contact us if you have any further questions.

1. The CFT code of the soil (on woven cotton).
2. Soil name.
3. Example of the standardized test material on woven cotton.

4. Discriminative Power

Discriminative Power Index (1-5 stars):

$$\frac{\sqrt{\sum_{i=1}^{n-1} \sum_{j=i+1}^n (1 - T_{(\mu_i = \mu_j)}) * ABS(\mu_i - \mu_j)}}{c}$$

CFT developed this way of quantifying the Discriminative Power of a Test material several years ago. It is based on the sum of the significance (Student T-Test) of all different results (in ΔY) times the size of this difference. This is scaled to a 5 star ratio.

Reproducibility Ratio

The Reproducibility Ratio (1-5 stars) indicates the consistency of the soiled Y-values (Y_s) within a batch, scaled on a ratio from 1 to 5 stars

Reliability Ratio

Reliability Ratio (1-5 stars):

The Reliability Ratio indicates the consistency of the repetitions in ΔY over the average cleaning levels ($Avg(Y_w)$). Indicates the consistency of results between repetitions, scaled on a ratio from 1 to 5 stars.

Popularity

Popularity of stain based on sales records.

5. Table with the order codes of this stain on different substrates. Also shows the width & Y_u (Y-unsoiled) value of the different substrates.
6. Circle diagram of the relative response to different components in the detergent.
7. Detergent dosage response & QC graph, including our thresholds for approval.
8. This box indicates if any relevant components are added to the IEC-A* in the Quality Control procedure.
9. Detergent component response table.
10. Legend of detergent component response table and circle diagram.
11. Comparison of commercial powder detergent. The different colors represent different powder detergents. The left bar shows the results on 40°C. The bar with the blue outline is showing the results on 25 °C.
12. Comparison of commercial liquid detergents. The different colors represent different liquid detergents. The left bar shows the results on 40°C. The bar with the blue outline is showing the results on 25 °C.

AS-Series

The AS-Series' products are the 13 products that CFT started its business with in 1989. These testmaterials can be categorized as 'technical' testmaterials. They are not as consumer realistic as the CS Series but are designed to show well discriminating and reliable results. The article coding was changed ten years later after CFT developed a large number of other testmaterials in the CS-Series. For example, AS-01 is now known as C-01. The first part of this new product code refers to the substrate fabric (e.g. C for cotton).

BC-Series

The BC-Series' products are a special group of products. These are all especially designed to isolate the bleach performance results only.

These products have in common that they are rinsed with water after application of the soil, thus removing the easy to remove soil and leaving the hard to remove bleachable part of the soil behind.

The advantage is that all of the soil removal can be contributed to the bleach system of your detergent. It can also be explained as Consumer Realistic: the first thing a consumer would do after a stain occurs, is to try to rinse it out with water. These products are not very suitable to test liquid detergents, because of the bleach sensitivity.

CS-Series

The CS-Series' or S-Series' products are all developed by CFT. The CS originally stood for Consumer Soils. These are soils with which the consumer would be confronted in reality.

To control reproducibility of these testmaterials we purchase the soil ingredients in very big quantities at a time, or we produce our own recipe (e.g. chocolate pudding), based on the average of ingredients used in various brands. After the introduction of our soils on different substrate fabrics the 'C' in the article code started to refer to 'Cotton' and is replaced depending on the type of fabric. The 'S' still remains to indicate that these testmaterials belong to the 'S'-Series.
